

Announcing Battery & Charger improvements for DBA Tables

This information should be very helpful

- **What are the advantages to the new system?** Our testing shows that this battery will hold a charge approximately **2 weeks** longer (as with MPG ratings, your own results may vary), and will accept a full charge in approximately 3½ hours from our new charger.
- **What are the disadvantages?** This battery costs a little more, is heavier, and will require a new charger to take advantage of the reduced charging time.
- **Can I change my existing table to use the [new 12v/18a battery](#)?** YES. Replace the positive and negative battery terminals with slightly-larger 0.250 14–16 gauge quick-connect insulated terminals. It's a fairly simple operation most any tech with electrical experience can manage in less than 8 minutes per table.
- **Can I use the [new 12v/18a battery](#) with the [prior-model charger](#)?** : Yes, but charging times will be significantly longer than for the 12v/12a battery, probably 48 hours for a full charge.
- **Can I use the new charger with the [12v/12a Battery](#)?** : Yes
- **Will the new charger improve charging time on the [12v/12a Battery](#)?** : Yes, a full charge should now take between 2 to 3 hours.
- **Will you continue stocking the [12v/12a Battery](#)?** : This battery will be stocked for Parts and Service for the foreseeable future but will probably be phased out early in 2011. Due to the reduced volume, price on this battery has increased slightly.
- **Will you continue stocking the [prior-model charger](#)?** These chargers will be available only while supplies last. Special pricing is available for a stock of used chargers from our burn-in rack (as we are using the newer chargers now) and for large quantity orders.
- **Will you continue stocking the 5-battery charging station?** That is now discontinued. Our tests found that 2 new-style chargers can fully charge 6 batteries in less time than the station could charge 5.
